

HyperTerminal for Windows 7

HyperTerminal is a Windows XP application that helps you to connect your computer to other remote computers.

Windows Vista or Windows 7 do not include this application by default. All the alternatives available are either paid and the free ones are not up to the mark.

From a computer with Windows XP, copy two files **hypertrm.dll** and **hypertrm.exe** from that system. Copy those files to your Windows Vista or Windows 7 computer. See the screenshot below.

Be sure to keep the files **hypertrm.dll** and **hypertrm.exe** in the same folder. Then launch the HyperTerminal client by double clicking the **hypertrm.exe** file.

This HyperTerminal client functions normally on your Windows Vista or a Windows 7 system as it would on any other Windows XP system.
